

Stands Unique Carbon Support/AV Instructions for assembly

Contents:
Carbon Fibre uprights in sets of four.
Carbon Support has 4 Tiers of glass as standard (16 legs), this can be added to or reduced to create a custom height support system. Carbon AV has three tiers (12 legs)

4 x M8 Nickel plated Steel spikes with locknut.
4 x Brass top cappings with black damping gasket rings and black self adhesive cover caps 12mm diameter (optional to use) (these cover caps are removable in case an isolation platform is used to allow the spike tip to drop into the top of the support.)

4 x 25mm M8 Stainless Steel allthread fixings with allen key hole to one end.
These are used to affix the top piece of structural glass. Use the allen key to aid the insertion into the end of the leg being fixed.

Ensure Carbon end tubes are in place at both ends of the leg - these must interface with the glass

Start with the base and work your way up to fully assemble the support. All uprights should be firmly hand tight to give an effective connection between glass and carbon fibre. Use the stainless steel Allthreads to connect each upright

13mm High
Carbon Fibre Isolators

Highly Recommended

22mm High
Carbon Fibre Isolators
(for use on equipment with deeper feet)

The Black gasket damping ring is placed into the recess at the lower edge of the top capping so it mates with the glass

Ensure the M8 x 25mm Stainless Steel allthread is flush with the recess in the top brass capping to allow the black cover cap to be affixed - it must be flush with the top of the capping. Tip: It is recommended to tighten the top cappings by holding the brass top capping and turning the allthread using the allen key together.

Highly recommended

Stands Unique
Isolation Shelf

We highly recommend the use of Carbon Fibre Isolators to directly connect the chassis of the equipment to the Carbon Support itself, this maximises the effect of the materials energy management properties.
